EventSheet AI — Lean System Architecture

Purpose

EventSheet AI is a Hebrew-first, RTL-native, Excel-first educational MVP that transforms messy event information into a professional Excel workbook for event managers.

The Excel workbook is the product.

Core Principle

The system does not replace the event manager.

The system organizes information, highlights missing data, and generates a structured workbook.

The manager reviews, corrects, and decides.

Locked Product Rules

- Hebrew First Product
- RTL Native
- Excel As The Product
- Excel Becomes Source Of Truth
- No Database
- No CRM
- No RSVP Platform
- No AI Auto Seating
- One-Way Pipeline
- WhatsApp First Input
- Product Must Accept Chaos
- Native Israeli Terminology
- Excel Mobile Compatibility
- AI Assists, Manager Decides
- Dynamic Guest Categories
- Build First, Academic Documentation Later

MVP Flow

1. User creates event.
2. User pastes messy event information.
3. System organizes information into structured preview.
4. User reviews and edits the preview.
5. System generates Excel workbook.
6. User downloads the workbook.

Architecture

Main Components

1. Event Intake UI

Collects:

- Event name
- Event date
- Venue
- Estimated guest count
- Messy event text

2. Organizer Engine

Converts messy text into structured data.

If AI is unavailable, use deterministic fallback parsing.

3. Review Preview

Shows editable structured sections:

- Guests
- Seating
- Suppliers
- Budget
- Risks
- Final Brief

4. Excel Generator

Creates a valid `.xlsx` workbook with all required sheets.

5. Download Layer

Allows user to download the generated workbook.

No Backend Requirement

The MVP should run with local state only.

A backend is allowed only if required for AI key protection, but it must not become a database or CRM.

Out Of Scope

- Login
- User accounts
- Database
- RSVP sending
- WhatsApp API
- Guest messaging
- Payments
- CRM
- AI auto seating
- Multi-user collaboration
- Real-time sync
- Mobile app
- Complex dashboard analytics

Definition Of Done

The MVP is complete when:

- User can enter event details.
- User can paste messy Hebrew event information.
- System shows structured preview.
- User can edit preview data.
- System generates a valid Excel workbook.
- Workbook opens correctly in Excel.
- Workbook includes all required sheets.
- UI is Hebrew-first and RTL.
